

Project : Website Monitoring & Notification System

Project Overview:

Built an automated website monitoring workflow using n8n to check website availability, detect service issues, store monitoring records, and send automated email alerts when a website becomes unavailable.

Tools & Technologies:

- n8n Workflow Automation
- Schedule Trigger
- HTTP Request Node
- IF Condition Logic
- Google Sheets Integration
- Gmail Integration

Workflow Explanation:

- Schedule Trigger runs the workflow automatically after a defined time interval
- HTTP Request checks the availability of the selected website.
- IF Condition evaluates the HTTP response status code.
- If the website is available (Status Code 200), the system records the website status in Google Sheets.
- If the website is unavailable, the system sends an automated Gmail alert notification.

Workflow Structure:

Schedule Trigger

HTTP Request (Website Check)

IF Condition (Status Code Check)

TRUE → Google Sheets Monitoring Log

FALSE → Gmail Website Down Alert

Features:

- Automated website availability monitoring
- Scheduled workflow execution
- Website status logging
- Automated downtime alerts
- Real-time email notifications
- Business process automation using n8n

Testing Results:

Website UP Test:

- A working website returned a successful response and the status was stored in Google Sheets.

Website DOWN Test:

- A simulated unavailable website response triggered the Gmail alert notification successfully.

Skills Demonstrated:

- Workflow Automation
- HTTP Request Handling
- Conditional Logic
- Data Logging
- Email Automation
- n8n Workflow Development
- Website Monitoring Concepts

Stack:

- n8n, HTTP Requests, Automation Workflows, Google Sheets, Gmail Integration
